                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC This CDNA sequence encodes the precursor (see AAW23723) of a novel, claimed antimicrobial peptide from bovine neutrophils, designated CC murine granulocyte peptide A or MGP-A (see AAW23725). It was considered from murine bone marrow cDNA using primers based on the MGP-A cDNA (see AAW23725). It was considered from murine bone marrow cDNA using primers based on the MGP-A cDNA (see AAW23725). The considered MGP-A precursor CC comprises signal peptide and propeptide sequences followed by 12 creminal amino acids corresponding to mature MGP-A. MGP-A and GGP-A (see AAW23724), exhibit activity against Gram-positive and GGP-A (see AAW23724), exhibit activity against Gram-positive and CC BGP-A (see AAW23724), exhibit activity against Gram-positive and CC Exam-negative bacteria, fungi and viruses, specifically staphylococcus aureus, Escherichia coli, Candida albicans, CC salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary medicine (particularly to treat claimed) or as preservatives in food products or in water cupiles (claimed). They can also be applied to crops to reduce post-harvest spoilage or expressed in transgenic plants to increase their disease resistance. They have low immunogenicity.

                                                                                                                                                                                   nucleotide sequences encoding them. The polynucleotide sequences given in AAA8606-A80623 encode the 12 secreted protein sequences given in AAA86066-A80623 encode the 12 secreted protein sequences given in AAA86066-A80623 encode the 12 secreted protein sequences given in AAA86066-A80623 encode the 12 secreted protein sequences given in CAAB25576-B2593. The human secreted protein shave various activities of the proteins include: immunosuppressant; antipiniferative; antiarteriosclerotic; anticancer; vulnerary; cantiproliferative; antiarteriosclerotic; anticancer; vulnerary; cantiviral; antibacterial; and antifungal activity. The proteins, conditions examples of the polyperides, agonists and antigonists may be used to treat prevent and/or diagnose various disease, disorders and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatoid arthritis, dermatitis, and multiple sclerosis; inflammatory disorders e.g. faddison's disease and nephritis; cardiovascular disorders such as paraproteinaemias and purpura; cardiovascular disorders e.g. coronary arteriosclerosis and myocarditis; cancer e.g. melanoma and lymphoma. The proteins and polynucleotide infertions disease in the human scorotid arthritis that the teatment of the factors and a sequences may also be used in wound healing and the treatment of

dependent on the tissues in which they are expressed. Examples o activities of the proteins include: immunosuppressant; anti-inflammatory; antiarthritic; antirheumatic, dermatological; antiproliferative; antiarteriosclerotic; anticancer; vulnerary; antiviral; antibacterial; and antifungal activity. The proteins, polypeptides, agonists and antagonists may be used to treat prevently of the proteins of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antirheumatic, dermatological; antiproliferative; antiarteriosclerotic; anticancer; vulnerary; antiviral; antibacterial; antifungal; immune disorder; Addison's disease; rheumatoid arthritis; dermatitis; multiple sclerosis; inflammatory disorder; inflammatory bowel disease;
                                                                                                                                                                    nucleotide sequences encoding them. The polynucleotide sequences given in AA80606-A80623 encode the 12 secreted protein sequences given in AA825576-B25593. The human secreted proteins have various activities
                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cances

                                                                                                                                      ABL25882 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell:cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection
                                                                                                                                                                                                                527
                                                                                                                                                                                                                                            609
                                                                                                                                                                                                                                                                       467
                                                                                                                                                                                                                                                                                                    549

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1509
                                                                                                                                                                                                                                                                                                                                                                                  1329
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence data for this patent did not form specification, but was obtained in electronic i
                                                                                                                                                                                      1212
                                                                                                                                                                                                                                                                                    1269
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1449 GGACCGTAGGCCTGGGCAACTACCTCAGCTACGCCATCATCCACCACCACCGCCGGCTCCT 1390

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The present invention describes an antibody that binds to a human protein (I) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; CC PRO3434; PRO1927; PRO3567; PRO1293; PRO1303; PRO4344; PRO4354; PRO4397; PRO1557; PRO1555; PRO1293; PRO1303; PRO4344; PRO4354; PRO4397; PRO4407; PRO1555; PRO1096; PRO2038; and PRO2262. (I) has certainly complex formation when the antibody is contacted with test (Cc lis. increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), and cespecially the antibodies, or an antisense oligonucleotide which (CC expecially the antibodies, or an antisense oligonucleotide which (CC expecially by inducing cell death. Methods from the present invention (CC can be used to identify compounds which inhibit the biological activity (CC of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation (CC probes used in examples from the present invention for human PRO (CC sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human (CC proposed) invention and protein sequences given in the exemplification of the present invention for human processors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              08-MAR-1999;

                                                                                                                                                                                                                                                                               AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAF54356;
                 The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents.
                                                                                                                                                                                                                                                                                                       WPI;

DNA sequence are used to express recombinant tag?. Tag? is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag? polypeptide inhibits tumour growth and induces apoptosis. The tag? coding sequences are also useful as probes for gene mapping and detection of tag? gene expression, and as primers. Antibodies against tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag? and the produces are also useful as probes for gene expression, and as primers. Antibodies against tag? are used as reagents for detecting tag?; as an antagonist of tag? are used as reagents for detecting tag? and thereagents for detecting tag?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (BOEH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
The present invention relates to 12 secreted human proteins and the CC nucleotide sequences encoding them. The polynucleotide sequences given in Nab86066-80623 encode the 12 secreted protein sequences given in CC AAB25576-B25593. The human secreted proteins have various activities CC dependent on the tissues in which they are expressed. Examples of the CC activities of the proteins include: immunosuppressant:
CC anti-inflammatory; antiarthritic; antirheumatic, dermatological;
CC antiproliferative; antiarteriosclerotic; anticancer; vulnerary;
CC antivital; antibacterial; and antifungal activity. The proteins,
CC polypeptides, agonists and antagonists may be used to treat prevent
CC and/or diagnose various disease, disorders and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatoid
CC arthritis, dermatitis, and multiple sclerosis; inflammatory disorders (e.g. inflammatory bowel disease, Crohn's disease and nephritis;
CC cardiovascular disorders e.g. coronary arteriosclerosis and myocarditis;
CC cancer e.g. melanoma and lymphoma. The protein and polynucleotide sequences may also be used in wound healing and the treatment of infectious diseases. The human secreted protein gene #8 and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Crohn's disease; nephritis; hyperproliferative disorder; cardiovascular disorder; coronary arteriosclerosis; myocarditis; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antirheumatic, dermatological; antiproliferative; antiarteriosclerotic; anticancer; vulnerary; antiviral; antibacterial; antifungal; immune disorder; Addisor's disease; rheumatoid arthritis; dermatitis; multiple sclerosis; inflammatory disorder; inflammatory bowel disease;
                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; Figure 34; 803pp;

                                                                                                                                                                                                                                                                                                                Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                  Novel human peptidoglycan recognition protein-like proteins (PGRP) expressed by keratinocytes (PGRP-K), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-C) are disclosed. The PGRP DNA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (claimed). PGRP is useful in augmenting the immune system in such areas as immune recognition, antigen presentation and immune system activation. Antibodies or antagonists directed against these proteins may be useful in reducing or eliminating disorders associated with tumour necrosis factor (TMF) and TMF-like cytokines, such as endotoxic shock and autoimmune disorders and for treating infectious diseases including silicosis, sarcoidosis and idiopathic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mat_peptide

          This CDNA sequence encodes the precursor (see AAW23722) of a novel claimed antimicrobial peptide from bovine neutrophils, designated bovine granulocyte peptide A or BGP-A (see AAW23724). It was isolated from bovine bone marrow cDNA using PCR and RACE procedures. The encoded BGP-A precursor comprises a 21-amino acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               acids corresponding to mature BGP-A. BGP-A and the murine homologue, MGP-A (see AAW23725), exhibit activity against Gram-positive and Gram-negative bacteria, fungi and viruses, specifically Staphylococcus aureus, Escherichia coli, Candida albicans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or vetterinary medicine (particularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post-harvest spoilage or expressed in transgenic plants to increase their disease resistance. They have low immunogenicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Хо

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular veight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; as an antagonist of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      336
```

claimed antimicrobial peptide from bovine neutrophils, designated murine granulocyte peptide A or MGP-A (see AAW33725). It was isolated from murine bone marrow CDNA using primers based on bovine BGP-A CDNA (see AAT78509). The encoded MGP-A precursor comprises signal peptide and propeptide sequences followed by 12 C-terminal amino acids corresponding to mature MGP-A. MGP-A and

cDNA sequence encodes the precursor (see AAW23723)

designated of a novel,

They can be used in human or veterinary medicine (particularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post-harvest spoilage or expressed in transgenic plants to increase

                                                                                                                                                                                                                                                                       CC ANY65438 represent the EST-related proteins any control of the ANY65438 represent the EST-related proteins corresponding to ANA24265 to ANX65438 represent the EST-related proteins corresponding to ANA24265 to CC ANX63052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated CC regions (UTRs) and upstream regulatory regions which control the coloration, development stage, rate, and quantity of protein synthesis, as concern as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in cliquents to procedures to identify individuals, or in cliquents from abnormal gene expression. The products may also be used in colorating from abnormal gene expression. The products may also be used in cused for directing extracellular secretion of a polypeptide can be conserved in the proteins encoded by the EST sequences may be useful in the acell. The proteins encoded by the EST sequences may be useful in the treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. ANX42249 to ANZ4264 and ANY64644 to ANY64650 represent in the coloration of the present invention.

The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLJ01840-ABLJ0175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID NO 29116;
                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid genes from Drosophila and
                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                        WPI; 2001-656860/75.
                                                                                                                                                                                                                                                                                                                                                                                                                                                23-MAR-2000; 2000US-191637P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 12
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention
                                           Claim 1; SEQ ID NO 29113; 21pp + Sequence Listing; English.
                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila melanogaster genomic polynucleotide SEQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    26-MAR-2002 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                      The invention relates to an isolated polypeptide comprising a 277, 480, CC 844, 782, 581, 628, 424, 638, 229, 310, 841, 241, 369, 382, 185, 586, 1026, CC 844, 782, 262, 394, 471, 485, 286, 533, 495, 350, 619, 490, 462, 255, CC 784, 252, 593, 472, 607, 781, 640, 686 or 154 amino acid sequence as CC given in the specification. The polypeptides, modulators of the C polypeptides and antibodies against the polypeptides are useful for C treating diseases such as neurological and psychiatric diseases CC including Alzhelmer's, parasupranuclear palsy, Huntington's disease, C myotonic dystrophy, anorexia and depression; cardiovascular diseases, CC including congestive heart failure, Hodgkin's disease and myocardial CC infarction; respiratory diseases including asthma, chronic obstructive CC pulmonary disease, cystic fibrosis and adult respiratory distress syndrome; liver diseases including hypercholesterolaemia, cirrhosis, CC viral and nonviral hepatitis, Type II diabetes mellitis, and impaired CC glucose tolerance; renal disease including renal failure, acute tubular CC excepts and glomerulomephritis; skeletal muscle diseases including CC diseases including myotonia congenita and intestinal obstruction; lymph (CC diseases including hyphagiactasia, diseases of placenta including chortocarcinoma; diseases of testes including testicular cancer, CC male reproductive diseases including low testosterone and male (CC Type 1 and 2 diabetes and obesity. The present sequence encodes a colveentide of the invention.

CC peptide (GP-A) homolog, Zgpal protein. Zgpal gene is located on human CC chromosome 1. Zgpal polypeptides are useful for producing antibodies CC which are useful for detecting cancer. Zgpal polypeptides having CC anti-microbial activity are useful for treating dental carries, CC periodontal disease, thrush, gastrointestinal disease, urinary tract CC infections, respiratory infections, vaginal infections acquired immune CC deficiency syndrome (AIDS) and lung infections associated with cystic CC ibrosis and prevention of infection in skin and other epithelial wounds. CC Zgpal-cytokine fusion proteins are useful for enhancing in vivo killing CC ovarian and rectal cancers). Zgpal polypeptides, fragments, fusion CC proteins or agonists are useful in in vitro studies of exogenous CC microorganism infections such as bacterial, viral or fungal infection and CC also to study epithelial call defensin induction in cell culture. Zgpal antibodies, polynucleotides and polypeptides are useful for detection of CC zgpal polypeptide, mRNA or anti-zgpal antibodies, thus serving as markers for detecting genetic diseases or cancers. Zgpal sequences are useful as CC diagnostics in forensic DNA profiling and as probes or primers to clone councers. Signal gene is antibodies are useful for detection as concers. Zgpal sequences are useful as neutralizing antibodies or as antagonists to block zgpal activity in vitro and in vivo. Zgpal gene is also useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New granulocyte peptide homolog, zgpal polypeptide, for research applications, diagnosis and treatment of cancer, periodontal, gastrointestinal disease, urinary tract, skin and lung infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 2; Page 107-109; 114pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; nootropic; neuroprotective; anticonvulsant; antidepressant; neuroleptic; tranquiliser; antiarrhythmic; cardiant; antiasthmatic; antiinflammatory; antilipsemic; hepatotropic; virucide; antidiabetic; nephrotropic; anorectic; cytostatic; vaccine; neurological disease; cardiovascular disease; respiratory disease; liver disease; renal disease; skeletal muscle disease; gastrointestinal disease; placental disease; testicular cancer; male fertility; pancreatic disease;
The invention relates to an isolated polypeptide comprising a 277, 480, 583, 581, 628, 424, 638, 229, 310, 841, 241, 369, 382, 185, 586, 1026, 844, 782, 262, 394, 471, 485, 286, 533, 495, 350, 692, 462, 255, 784, 252, 593, 472, 607, 781, 640, 686 or 154 amino acid sequence as given in the specification. The polypeptides, modulators of the polypeptides and antibodies against the polypeptides are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1075
                                                                                                                                                                                                                                               asthma,
                                                                                                                                                                                                                                                                  Novel polypeptides and polynucleotides useful as a vaccine for preventing and treating diseases associated the polypeptide, e.g. altheomer's disease, dyslipidemia, obesity, diabetes, infertility,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (SMIK )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABA90337
